#### CITY OF PORT NECHES, TEXAS 2022 Annual Drinking Water Quality Report

#### **Our Drinking Water is Regulated**

This report is a summary of the quality of the water we provide our customers. The analysis was made using the data from the most recent U.S. Environmental Protection Agency (EPA) required tests. The tables below show only those contaminants that were detected in the water.

#### Where Do We Get Our Drinking Water?

The source of drinking water used by the City of Port Neches is Surface Water. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals, and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water before treatment include: microbial contaminants such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

#### **All Drinking Water May Contain Contaminants**

When drinking water meets federal standards there may not be any health based benefits to purchasing bottled water or point of use devices. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe drinking Water Hotline (1-800-426-4791).

#### **Secondary Constituents**

Many constituents (such as calcium, sodium, or iron) which are often found in drinking water can cause taste, color, and odor problems. The taste and odor constituents are called secondary constituents and are regulated by the State of Texas, not the EPA. These constituents are not causes for health concern. Therefore secondary constituents are not required to be reported in this document but they may greatly affect the appearance and taste of your water.

#### **Source Water Assessment**

The TCEQ completed an assessment of your source water and results indicate that some of your sources are susceptible to certain contaminants. The sampling requirements for your water system are based on this susceptibility and previous sample data. Any detections of these contaminants may be found in this Consumer Confident Report. For more information on source water assessments and protection efforts at our system, contact Phillip Pryor at (409)722-4024 or visit <a href="http://www.tceq.texas.gov/gis/swaview">http://www.tceq.texas.gov/gis/swaview</a> or <a href="http://dww2.tceq.texas.gov/DWW">http://dww2.tceq.texas.gov/DWW</a>

#### Required Additional Health Information for Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. This water supply is responsible for providing high quality drinking water but cannot control the variety of material used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. For information on lead in drinking water, testing methods, and steps you can take to minimize exposure call the Safe Water Hotline or http://www.epa.gov/safewater/lead.

#### Special Notice - (Required for all community public water supplies)

You may be more vulnerable than the general population of certain microbial contaminants, like Cryptosporidium, in drinking water. Infants, some elderly or immune-compromised persons such as those undergoing chemotherapy for cancer, those who have undergone organ transplants; those who are undergoing treatment with steroids; and people with HIV/AIDS or other immune system disorders can be particularly at risk from infections. You should seek advice about drinking water from your physician or health care provider. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available for the Safe Drinking Water Hotline at (800) 426-4791.

#### **Water Loss Statement**

In the water loss audit submitted to the Texas Water Development Board for the time period of January-December 2022, our system lost an estimated 84,741,306 gallons of water. If you have any questions about the water loss audit please call 409-722-4024.

#### En Españo

Este informe incluye información importante sobre el agua potable. Si tiene preguntas o comentarios sobre éste informe en español, favor de ilamar al tel. (409) 722-4024 para hablar con una persona bilingúe en español.

#### **Public Participation Opportunity**

RANGE OF LEVELS DETECTED

MCLG

**REGULATED CONTAMINANTS** 

COLLECTION DATE HIGHEST LEVEL

### **ABBREVIATIONS**

NTU Nephelometric Turbidity Units

**pCi/L** picocuries per liter (measure of radioactivity)

**ppm** parts per million, or milligrams per liter (mg/L)

**ppb** parts per billion, or micrograms per liter (ug/L)

**ppq** parts per quadrillion, or picograms per liter

**ppt** parts per trillion, or nanograms per liter

NA Not Applicable

### **DEFINITIONS**

# Maximum Contaminant Level Goal (MCLG)

The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

# Maximum Contaminant Level (MCL)

The highest level of a contaminant that is allowed in drinking water. MCLS are set as close to the MCLGs as feasible using the best available treatment technology.

# Maximum Residual Disinfectant Level (MRDL)

The highest level of a drinking water disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

# Maximum Residual Disinfectant Level Goal (MRDLG)

The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits the use of disinfectants to control microbial contaminants.

### Action Level (AL)

The concentration of a contaminant which, if exceeded, triggers treatment.
